

# CIGAR OPENER

## Abstract

A cigar opener assembly (10) includes a cover (12) and blade housing (14) having a blade (16) therein. The cover (12) and blade housing (14) rotate relative to each other so that openings (22, 24) through the cover (12) align with a channel (38) within the blade housing (14). After use, the cover (12) may be rotated relative to the blade housing (14) so that the blade is no longer accessible.
